1. Introduction

A Video Sharing Platform is a web application that lets users upload, share, and watch videos online. Similar to well-known platforms like YouTube, this project plans to create a straightforward system where users can create accounts, upload their videos, and watch videos uploaded by others. The platform will also let users like, comment on, and share videos with others.

2. Objective

- To create a platform that makes it easy for users to upload and watch videos.
- For user account and profile feature management.
- This enables features such as search, like, comment, and share.
- to effectively use a database for managing and storing video data
- To ensure secure login and data privacy for all users.

3. Scope of the Project

- offers a straightforward and easy-to-use platform for online video sharing.
- enables the uploading and viewing of video content by students, content producers, and local groups.
- enables basic video-sharing functions like uploading, streaming, like, commenting, and subscribing to videos.
- provides features for managing videos and safe user authentication.
- avoids the complexity of extensive video-sharing networks by concentrating on key functionality.

Future Scope:

- Incorporation of live streaming capabilities.
- Creation of a version of the mobile application.
- Deployment of video recommendation systems powered by AI.
- Features that allow content providers to make money are added.

4. System Requirements

4.1 Hardware Requirements

- Processor: Intel i3 or above
- RAM: 4 GB or more
- Hard Disk: 50 GB free space (for storing videos and database)
- In order to host and access the platform, an internet connection is necessary.

4.2 Software Requirements

- Operating System: Windows 10 / Linux
- Frontend: HTML, CSS, JavaScript, React
- Backend: Node.js .
- Database: MongoDB / MySQL
- Tools: Visual Studio Code, Git, Postman

5. Proposed Modules

5.1 User Module

- User registration, login, and profile management.

5.2 Video Upload Module

- Upload, edit, delete, and categorize videos.

5.3 Video Playback Module

- Stream videos and view related content.

5.4 Interaction Module

- Like, comment, and share videos.

5.5 Search Module

- Search videos by title, category, or uploader.

5.6 Admin Module

- Manage users, moderate content, and view platform statistics.

6. Working of the System

The following easy steps are how the system operates:

- A user logs in or registers on the platform.
- A title, description, and category can be added before uploading a video.
- The user's account in the database is connected to the video, which is kept on the server.
- The submitted videos are available for browsing, searching, and viewing by other users.
- The videos that viewers watch can be liked, commented on, or shared.
- The administrator keeps an eye on the platform to make sure material complies with rules.

7. Advantages of the Proposed System

- A user-friendly interface suitable for all kinds of users.
- gives up-and-coming content producers a stage on which to present their work.
- can be expanded with new features in the future and modified.
- economical in comparison to big commercial platforms.

8. Conclusion

The goal of the Video Sharing Platform project is to make it simple and effective for people to upload, share, and view videos on the internet. It provides a straightforward and user-friendly experience while facilitating user interaction with features like likes, comments, and subscriptions. This project gives us practical experience with database administration, program design, and web development. Future enhancements like live streaming, mobile application support, and AI-based video recommendations can be built upon the platform.
